

25G LC BIDI SFP28 LR Transceiver

[IBP-25xxyyB-C20I]

Key Features

- SFP28 Transceivers for 20km Transmission
- Single +3.3V Power Supply
- LC BIDI Connector

♦ Features

- Uncooled DFB Laser transmitter
- High sensitive PIN PD Receiver
- LC BIDI optical receptacle
- SFF-8472 compliant digital diagnostic monitoring function implemented
- Operating case temperature range from 0° to 70° (-40° to +85°:Option)
- Low power consumption: Max. 1.5W
- Hot-pluggable to 20-pin electrical interface
- 2-wire management interface
- Class 1 Laser safety
- RoHS 6/6 compliant

♦ Applications

- Local area networks
- Wide area networks
- Digital Wireless Repeater
- Storage area networks

1. Functional Description

The transceiver is the SFP28 optical transceiver module which is a hot pluggable form factor designed for high speed optical networking application. The transceiver is designed for 25Gigabit Ethernet application, 2-wire management interface. The transceiver converts 25Gb/s electrical data streams to 25Gb/s optical output signal and 25Gb/s optical input signal 25Gb/s electrical data streams.

The high performance DFB LD transmitter and high sensitivity PIN PD receiver provide superior performance for 25Gigabit Ethernet applications up to 20km links.

The transceiver is designed to used in a single power supply (+3.3V) and an operating temperature range of 0° C to +70°C (-40°C to +85°C:Option).

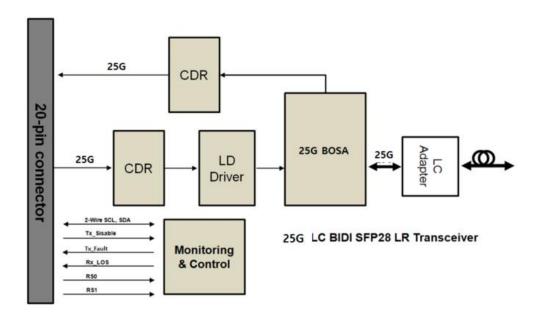

Figure 1. Transceiver block diagram

1.1 Low Speed Description

1.1.1 Low Speed Pin Descriptions

The transceiver has several low-speed interface connectors including a 2-wire serial interface (SCL and SDA). These connections include: Tx_Fault, Tx_Disable, RS0/RS1, Mod_ABS, Rx_LOS.

[Tx_Fault]

Tx_Fault is a module output that when high, indicates that the module transmitter has detected a fault condition related to laser operation or safety. If Tx_Fault is not implemented, the Tx_Fault contact signal shall be held low by the module and may be connected to Vee within the module. The Tx_Fault output is an open drain/collector and shall be pulled up to the Vcc_Host in the host with a resistor in the range 4.7 kOhms to 10 kOhms.

[Tx_Disable]

When Tx_Disable is asserted high or left open, the SFP+ module transmitter output shall be turned off unless the module is a passive cable assembly (see Appendix E in SFF-8419) in which case this signal may be ignored. This contact shall be pulled up to VccT with a 4.7 kOhms to 10 kOhms resistor in modules and cable assemblies.

Tx_Disable is a module input contact. When Tx_Disable is asserted low or grounded the module transmitter is operating normally.

[RS0/RS1]

RS0 and RS1 are module inputs and are pulled low to VeeT with >30 kOhms resistors in the module. RS0 optionally selects the optical receive signaling rate coverage. RS1 optionally selects the optical transmit signaling rate coverage. For logical definitions of RS0/RS1 see Section 4.2. These contacts can also be used for AS0 and AS1 if implementing SFF-8079. See SFF- 8079 for details.

RS1 is commonly connected to VeeT or VeeR in the classic SFP modules. The host needs to ensure that it will not be damaged if this contact is connected to VeeT or VeeR in the module.

[Mod ABS]

Mod_ABS is connected to VeeT or VeeR in the SFP+ module. The host may pull this contact up to Vcc_Host with a resistor in the range 4.7 kOhms to 10 kOhms. Mod_ABS is asserted 'High' when the SFP+ module is physically absent from a host slot. In the SFP MSA (INF-8074i) this contact has the same function but is called MOD_DEF0.

[Rx_LOS]

Rx_LOS when high indicates an optical signal level below that specified in the relevant standard.

RoHS Compliant

Rx_LOS is an open drain/collector output, but may also be used as an input by supervisory circuitry in the module. For a nominally 3.3 V Vcc_Host using a resistive pull up to Vcc_Host the resistor value shall be in the range 4.7kOhms to 10 kOhms. For a nominally 2.5 V Vcc_Host using a resistive pull up to Vcc_Host the resistor value shall be in the range 4.7 kOhms to 7.2 kOhms. The Rx_LOS signal is intended as a preliminary indication to the host in which the module is installed that the received signal strength is below the specified range. Such an indication typically points to non-installed cables, broken cables, or a disabled, failing or a powered off transmitter at the far end of the cable.

Additional indications are provided by the host in which the module is installed to verify that the information being transmitted is valid, correctly encoded, and in the correct format. Such additional indications are outside the scope of the module specification.

Rx_LOS may be an optional function depending on the supported standard. If the Rx_LOS function is not implemented, or is reported via the two-wire interface only, the Rx_LOS contact shall be held low by the module and may be connected to Vee within the module.

Rx_LOS assert min and de-assert max are defined in the relevant standard. To avoid spurious transition of Rx_LOS a minimum hysteresis of 0.5 dBo is recommended.

1.1.1 Low Speed Pin Electrical Specifications

[Low Speed Signaling]

Low speed signaling other than SCL and SDA is based on Low Voltage TTL (LVTTL) operating at Vcc. Vcc refers to the generic supply voltages of VccTx, VccRx, Vcc_host or Vcc1.

Hosts shall use a pull-up resistor connected to Vcc_host on each of the 2-wire interface SCL (clock), SDA (data), and all low speed status outputs.

The SCL and SDA is a hot plug interface that may support a bus topology. During module insertion or removal, the module may implement a pre-charge circuit which prevents corrupting data transfers from other modules that are already using the bus.

2. Application

Recommended MSA connections to the transceiver are shown in Figure 4 below.

Power supply filtering is recommended for the transceiver.

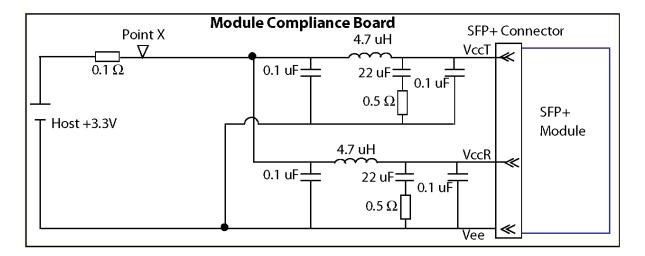

Fig 4. MODULE COMPLIANCE BOARD POWER SUPPLY FILTERS

3. PIN description

Figure 5 shows the signal symbols and contact numbering for the module edge connector. The diagram shows the module PCB edge as a top and bottom view. There are 20 contacts intended for high speed signals, low speed signals, power and ground connections.

RoHS Compliant

9. ESD(Electrostatic Discharge)

The module speed signal contacts shall withstand 1000 V electrostatic discharge based on Human Body Model per JEDEC JESD22-A114-B.

10, Laser Safety

The transceivers use a semiconductor laser that is classified as Class 1 laser products per the laser safety requirements of FDA/CDRH, 21 CFR1040.10 and 1040.11. These products have also been tested and certified as Class 1 laser products per IEC60825-1:2007 and IEC60825-1:2001 International standards.

RoHS Compliant
